

Amendment to the Claims:

This listing of claims replaces all prior versions, and listings, of claims in the application:

1. Cancelled.

2. (Currently Amended) The method of claim ~~[[1]]~~ 5 wherein the assignments include a voice timeslot, an unassigned timeslot, and a data timeslot.

3. Cancelled.

4. Cancelled.

5. (Currently Amended) ~~[[The]]~~ A method comprising: of
~~claim 3~~
receiving frames partitioned into multiple timeslots;
reading a timeslot lookup table including an entry
that specifies an assignment corresponding to a timeslot;
storing data associated with a particular timeslot in
a memory location based on the assignment, with data from a
particular channel included in timeslots having a data
assignment stored in contiguous memory locations; and
calculating the number of timeslots associated with a
set of data timeslots, wherein calculating the number of
timeslots includes locating a start-point and an end-point of a
set of data non-consecutive channels in a frame having the same
assignment.

6. (Original) The method of claim 2 wherein timeslots having a voice assignment or an unassigned timeslot separate the timeslots having a data assignment in the frame.

7. (Original) The method of claim 2 wherein storing the data comprises:

storing the data included associated with voice timeslots in a first memory;

storing the data associated with data timeslots in a second memory; and

discarding the data associated with unassigned timeslots.

8. (Original) The method of claim 2 wherein storing the data comprises:

storing the data associated with voice timeslots in a first subset of locations in the memory;

storing the data associated with data timeslots in a first subset of locations in the memory; and

discarding the data associated with unassigned timeslots.

9. (Currently Amended) The method of claim [[1]] 5 further comprising storing the frames associated with a voice assignment in a memory in the order the frames are received.

10. (Currently Amended) The method of claim [[1]] 5 further comprising storing the frames associated with a voice assignment such that all voice assignment frames from a channel for a particular frame are stored contiguously.

11 - 35. Cancelled.

36. (New) A computer program product, tangibly embodied in a computer-readable medium, when executed by a computer, perform operations comprising:

receiving frames partitioned into multiple
timeslots;

reading a timeslot lookup table including an
entry that specifies an assignment corresponding to a timeslot;

storing data associated with a particular
timeslot in a memory location based on the assignment, with data
from a particular channel included in timeslots having a data
assignment stored in contiguous memory locations; and

calculating the number of timeslots associated
with a set of data timeslots, wherein calculating the number of
timeslots includes locating a start-point and an end-point of a
set of data non-consecutive channels in a frame having the same
assignment.

37. (New) The computer program product of claim 36,
wherein the assignments include a voice timeslot, an unassigned
timeslot, and a data timeslot.

38. (New) The computer program product of claim 37,
wherein timeslots having a voice assignment or an unassigned
timeslot separate the timeslots having a data assignment in the
frame.

39. (New) The computer program product of claim 37,
wherein storing the data comprises:

storing the data included associated with voice
timeslots in a first memory;

storing the data associated with data timeslots
in a second memory; and

discarding the data associated with unassigned
timeslots.

40. (New) The computer program product of claim 37,
wherein storing the data comprises:
 storing the data associated with voice timeslots
in a first subset of locations in the memory;
 storing the data associated with data timeslots
in a first subset of locations in the memory; and
 discarding the data associated with unassigned
timeslots.

41. (New) The computer program product of claim 36, wherein
calculating the number of timeslots includes locating a start-
point and an end-point of a set of data non-consecutive channels
in a frame having the same assignment.

42. (New) The computer program product of claim 36, the
operations further comprising storing the frames associated with
a voice assignment in a memory in the order the frames are
received.

43. (New) The computer program product of claim 36, the
operations further comprising storing the frames associated with
a voice assignment such that all voice assignment frames from a
channel for a particular frame are stored contiguously.

44. (New) A system comprising:
 a processor; and
 a computer program product, tangibly
embodied on a computer-readable medium to cause the processor to
perform operations comprising: receiving frames partitioned into
multiple timeslots;

reading a timeslot lookup table
including an entry that specifies an assignment corresponding to
a timeslot;

storing data associated with a
particular timeslot in a memory location based on the
assignment, with data from a particular channel included in
timeslots having a data assignment stored in contiguous memory
locations; and

calculating the number of timeslots
associated with a set of data timeslots, wherein calculating the
number of timeslots includes locating a start-point and an end-
point of a set of data non-consecutive channels in a frame
having the same assignment.

45. (New) The system of claim 44, wherein the assignments
include a voice timeslot, an unassigned timeslot, and a data
timeslot.

46. (New) The system of claim 45, wherein timeslots having
a voice assignment or an unassigned timeslot separate the
timeslots having a data assignment in the frame.

47. (New) The system of claim 45, wherein storing the data
comprises:

storing the data included associated with voice
timeslots in a first memory;

storing the data associated with data timeslots
in a second memory; and

discarding the data associated with unassigned
timeslots.

48. (New) The system of claim 45, wherein storing the data comprises:

storing the data associated with voice timeslots in a first subset of locations in the memory;

storing the data associated with data timeslots in a first subset of locations in the memory; and

discarding the data associated with unassigned timeslots.

49. (New) The system of claim 44, wherein calculating the number of timeslots includes locating a start-point and an end-point of a set of data non-consecutive channels in a frame having the same assignment.

50. (New) The system of claim 44, the operations further comprising storing the frames associated with a voice assignment in a memory in the order the frames are received.

51. (New) The system of claim 44, the operations further comprising storing the frames associated with a voice assignment such that all voice assignment frames from a channel for a particular frame are stored contiguously.
